                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      STAGE, IS NECESSARY FOR T7 GENETIC RECOMBINATION AND THE BREAKDOWN OF HOST DNA. IN THE EARLY STAGE OF INFECTION, T7 DNA REPLICATES AS A LINEAR MONOMER. IN THE LATE STAGE, THE T7 DNA REPLICATES VIA LINEAR CONCATEMERS SEVERAL GENOMES IN LENGTH. THE GENE 3 PRODUCT HAS ALSO BEEN IMPLICATED IN THE MATURATION OF THESE CONCATEMERS. CATALYTIC ACTIVITY: Endonucleolytic cleavage to 5'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CATALYTIC ACTIVITY: Endonucleolytic cleavage to phosphooligonucleotide end-products.

-I- FUNCTION: THIS PROTEIN BINDS DIRECTLY TO 23S RIBOSOMAL RNA AL

LOCATED AT THE AMINOACYL-TRNA BINDING SITE OF THE

PEPTIDYLTRANSFERASE CENTER (BY SIMILARITY).

-I- SIMILARITY: BELONGS TO THE L6P FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                           Chloroplast.

Agents Chemother. 38:2460-2464(1994).

-I- FUNCTION: DNA GYRASE NEGATIVELY SUPERCOILS CLOSED CIRCULAR DOUBLE-STRANDED DNA IN AN ATP-DEPENDENT MANNER AND ALSO CATALYZES THE INTERCONVERSION OF OTHER TOPOLOGICAL ISOMERS OF DOUBLE-STRANDED DNA RINGS, INCLUDING CATENANES AND KNOTTED RINGS.

-I- CATALYTIC ACTIVITY: ATP-dependent breakage, passage and rejoining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oppegaard

gamma; are produced by alternative splicing.

--- TISSUE SPECIFICITY: Predominantly expressed in liver. While the alpha form is also expressed in spleen, lung, muscle, prostate and peripheral blood mononuclear cells, the beta form is expressed in all tissues tested, albeit weakly.

--- DISEASE: Defects in TFR2 are a cause of hereditary hemochromatosis type III (HFE3). HFE3 is a disorder of iron hemostasis resulting in iron overload and has a phenotype indistinguishable from that of hereditary hemochromatosis (HH). HH is characterized by albourmal intestinal iron absorption and progressive increase of total body iron, which results in middlife in clinical complications including cirrhosis, cardiopathy, diabetes, endocrine dysfunctions, arthropathy, and susceptibility to liver cancer. Since the disease complications can be effectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TISSUE-Carcinoma, and Embryo;

                                                                                                                                                                                                                                                                                                                                                                                                                                                 PATHWAY: PENULTIANTE STEP IN HEME AND PORPHYRIN BIOSYNTHESIS.
SUBUNIT: HOMODIMER.

SUBCELLULAR LOCATION: BOUND TO THE MITOCHONDRIAL INNER MEMBRAN
WITH ITS ACTIVE SITE FACING THE CYTOSOLIC SIDE (BY SIMILARITY)
TISSUE SPECIFICITY: EXPRESSED IN HEART, BRAIN, PLACENTA, LUNG,
LIVER, SKELETAL MUSCLE, KIDNEY, AND PANCREAS.

DISEASE: DEFECTS IN PPOX ARE THE CAUSE OF PORPHYRIA VARIEGATA
(VP), A DISEASE CHARACTERIZED BY SKIN HYPERPIGMENTATION AND HE
HYPERTRICHOSIS, ASSOCIATED WITH ACUTE ATTACKS, LIKE THOSE OF INTERNITENT PORPHYRIA.

SIMILARITY: BELONGS TO THE PROTOPORPHYRINOGEN OXIDASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          IX TO FORM PROTOPORPHYRIN IX.
CATALYTIC ACTIVITY: Protoporphyrinogen-IX +
IX + H(2)0(2).
COFACTOR: CONTAINS ONE FAD PER HOMODIMER.
                                                                                                                                                                                                                                                                                        176200;
